I could invent a new technique, my own, how to clean dirty water, and use it in the garden, and that would seem innovative and sophisticated, but it is smarter, to look for all the possible options, the one that works best, and the Circle of Banana Trees, is a 100% efficient permacultural technique, already tested and approved by several people, and satisfies the requirements of reuse, being the choice for the valuation of the system, only a precaution regarding the combination between water use, rainfall, absorption and drainage of the soil. And trying to invent another biological technique would require a margin of error which I can not subject myself to by being surrounded by other houses, and still tutoring a pack of 10 dogs. So opting for what is already known, and works, is the best solution to this problem, inventing new things is useful, but also brings risks.
